Bug fixes

API issue - Worker Sync not returning merged Personnel

In the current implementation, combined profiles are conveyed in the response using a "conflict" array, intended to signal to the receiving system that profiles have undergone merging. Regrettably, this functionality has not been operating as intended in the production environment.

As a resolution, a revised version of the endpoint is now accessible. This updated version empowers the source system to transmit the original ID (which has been merged into a new profile), and in turn, the API response will furnish the most recent merged profile details.

Thanks to Sravan Kumar from Accenture for raising this issue.

Project reports now delivered via email

Exporting a project from MyPass generates the 3 following reports:

- Project Personnel Report
- Project Role Tracking Report
- Project Requirements Report

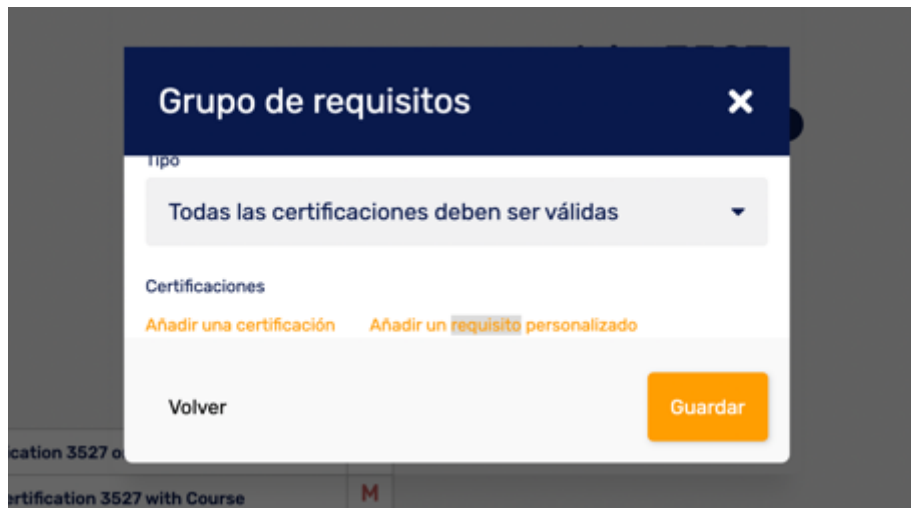

As the project functionality expands, accompanied by an increase in data volume, these reports will no longer be generated and downloaded to the browser. Instead, they will be generated by the MyPass reporting service and emailed to the user who requested them.

Thanks to Chelsea Browning from BHP for highlighting this issue.

Inability to add custom requirements

In the Spanish-translated version of the portal, users previously faced difficulties in adding custom requirements to the certificate group functionality.

This issue has been addressed, and now the option is accessible in both English and Spanish.

Personnel certificates loading indefinitely

An issue has been identified where a user encounters difficulty accessing a worker's certificates when the timestamp for the certificate is NULL. This occurs specifically when the same certificate is added multiple times, resulting in the creation of an array of attainments.

The issue has now been resolved and logic introduced to ensure all certificates are returned as expected.

Thanks to Gillian Kennedy (Woodgroup), Sharon Abel (EnerMech) & Brooke Lombardo (Programmed) for raising this issue.

Unable to update Billing Name within Billing Details

Certain users are experiencing difficulty saving their subscription details, attributed to a failure in synchronising their subscription address with our third-party address API.

MyPass has implemented essential logic to handle errors raised during synchronisation with the address API. This ensures seamless updating of billing details without encountering any issues.

Thanks to Paula Thrussell at Woolpert for raising this issue.

Subscription renewal reminder inaccurate

Customers receiving MyPass subscription renewal reminders on a quarterly/annual basis may have noticed notifications displaying figures that do not consider recent price increases in the cost per worker model.

We apologise for any inconvenience, the communication has been revised to accurately reflect the necessary changes.

Thanks to Diana Virag at Roteq Australia for raising this issue.
